Presentation of Davies based on WebDav by Pauline Mak. Shibboleth on the servlet. Automatic account creation, client provides certificate. WebDav provides already a way of doing a metadata search in the protocol, something that could be integrated in a more standard way.

Hermes browser: can connect to srb, irods, gsiftp, ftp and sftp services. All the srb functionalities are not there for irods. Recursive and sticky bit permission for srb. Not as sophisticated as Davies. There is a search engine based on metadata.

Davis and Hermes are available for download.

Some details can be also found in Pauline'talk in the Monday morning session.
